Arrays of Objects in Java

An array of objects is created like an array of primitive-type data items

Example: Create an array of five Student objects by instantiating each Student using its constructor and storing their references in the array.

```
class Student {
   public int roll_no;
   public String name;
    Student(int roll_no, String name){
       this.roll_no = roll_no;
       this.name = name;
   }
}

public class Geeks {
   public static void main(String[] args){

      Student[] arr =  new Student[5];

       // initialize the elements of the array
       arr[0] = new Student(1, "aman");
       arr[1] = new Student(2, "vaibhav");
       arr[2] = new Student(3, "shikar");
       arr[3] = new Student(4, "dharmesh");
       arr[4] = new Student(5, "mohit");

       // accessing the elements of the specified array
       for (int i = 0; i < arr.length; i++)
           System.out.println("Element at " + i + " : { "
                              + arr[i].roll_no + " "
                              + arr[i].name+" }");
   }
}
```

Output

```
Element at 0 : { 1 aman }
```

```
Element at 1 : { 2 vaibhav }
Element at 2 : { 3 shikar }
Element at 3 : { 4 dharmesh }
Element at 4 : { 5 mohit }
```
